

Client Testing Report COMP 584 Email Campaign (Arootin Auto Care)

The email campaign was tested by sending the HTML file through Gmail to observe how different elements render in real-world clients. The layout included a hero image, two column and three column sections, interactive components (checkbox reveal, radio tabs), and a keyframe animation. Responsiveness and stacking were tested on both desktop and mobile views.

Results In Gmail (Web): The structure, text, and buttons displayed correctly. The columns stacked properly on mobile and the interactive elements were visible but limited in functionality. Images did not appear because Gmail does not load local or relative image paths. This is expected behavior, and in a live campaign, these would be replaced with hosted URLs or Base64-encoded images.

In Apple Mail (Desktop): All layout elements appeared correctly, including images when opened locally. Animations using keyframes worked properly. Checkbox and radio interactivity was functional.

Analysis Most of the visual and responsive goals were achieved. The email adapts to mobile screens, the two-column and three-column layouts collapse correctly, and inline CSS ensures better client compatibility. Limitations in image loading and interactive support are common and documented in real world email campaigns. If hosted images were used (GitHub Pages or Cloudinary or something), the email would fully render across all clients. Overall, the campaign demonstrates correct application of responsive design, accessibility, and interactivity principles for HTML email.
