

Client Testing Notes - Interactive Email

Sent to self and viewed on: Apple Mail (macOS), iOS Mail, Gmail (Web), Outlook (Windows).

Observed behaviors: animations work in Apple/iOS Mail; Gmail Web strips some CSS in the head but retains inline styles; Outlook (Word engine) ignores radio/checkbox interactivity. Action items: provide graceful fallbacks, avoid critical info in interactive blocks, ensure buttons and links remain fully functional everywhere.

What Worked / What Didn't

Worked: responsive stacking in Apple/iOS Mail and many Android clients; bulletproof buttons; alt text; simple table structure. Didn't: background image area in some Outlook versions; keyframe animations on Windows Outlook; CSS-only tabs ignored in Word-based engines.
